

# DeskIA BPA

Process outcome verification using evidence.

## How it works

**Define.** Protected outcome, unit of analysis, window and criteria.

**Gather.** Authorized, current and correlated evidence from agreed sources.

**Assess.** Distinguish verified outcomes, unmet criteria and insufficient evidence.

**Continue.** Record the conclusion and next action; do not assume success.

## Dependencies

**Data and owners.** Shared identifiers, source owners, permissions and authoritative evidence for each outcome.

A favorable technical signal does not, by itself, establish the business outcome.

Scope requires agreed integrations, permissions, sources and criteria. Effective features are validated for each environment.

## Request a demo
